Baggage Handling System and Power and Lighting

Ross & Baruzzini conducted a master plan study for the new airport. The proposed power and lighting distribution systems and equipment were reviewed for completeness and proper application. Much of the electrical systems was designed for emergency operation. The scope of the project included designing a fully automated Baggage Handling System to serve all the functions involved in an international airport: domestic outbound flights make-up at the terminal bagroom, international outbound flights make-up at the satellite bagroom.
